

Supplement

Supplement A. Interrupted Time Series Analysis Framework

$$Y_t = \beta_0 + \beta_1 T_{1t} + \beta_2 X_{1t} + \beta_3 T_{2t} X_{1t} + \beta_4 X_{2t} + \beta_5 T_{3t} X_{2t} + \varepsilon_t,$$

where:

Y_t = Outcome at time t

β_0 = Y-intercept

β_1 = Slope (change due to a 1-unit increase in time) from 1 to time = 29

β_2 = Level change after the X-waiver relaxation policy (time = 29)

β_3 = Change in the slope following the X-waiver relaxation policy at time = 29 relative to Segment 1

β_4 = Level change after the X-waiver elimination policy (time = 50)

β_5 = Change in the slope following the X-waiver elimination policy at time = 50 relative to Segment 2

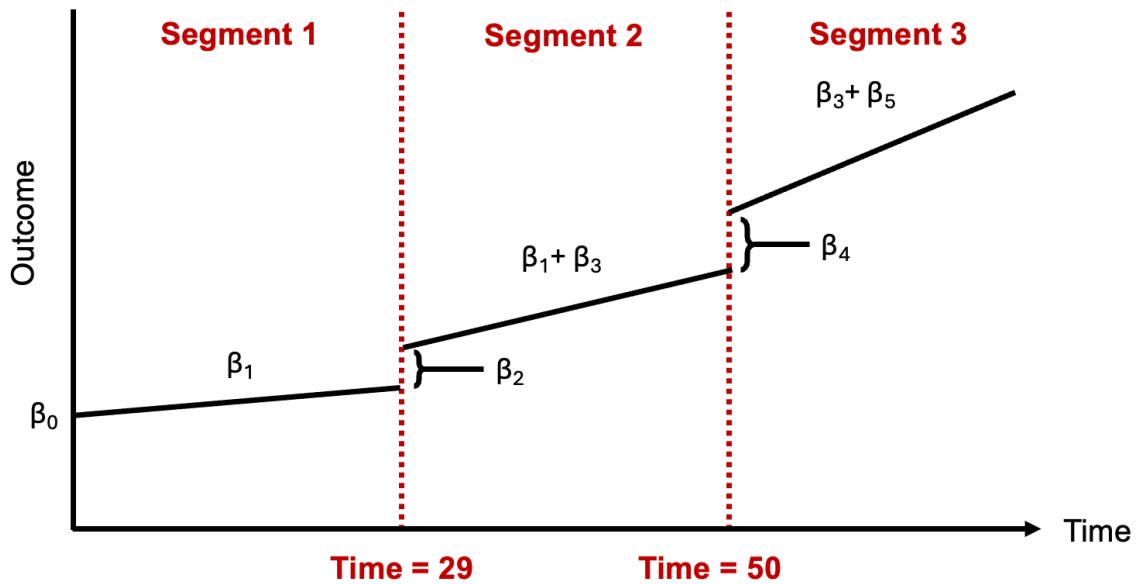

T_{1t} = Time before the X-waiver relation policy (time < 29)

T_{2t} = Time after the X-waiver relaxation (time < 29) policy and before the X-waiver elimination policy (time ≥ 29 and time < 50)

T_{3t} = Time after the X-waiver elimination policy (time ≥ 50)

X_{1t} = Time when the X-waiver relaxation policy is implemented (time = 29)

X_{2t} = Time when the X-waiver elimination policy is implemented (time = 50)

Supplement B. Trends for the number of individuals with opioid use disorder (OUD) and the number of individuals with OUD who received buprenorphine.
